Corpus linguistics has generated a number of research methods, which attempt to trace a path from data to theory. Wallis and Nelson (2001) first. A practical guide to descriptive translation. **Qualitative Content Analysis - PsychOpen**

Research, defines Qualitative Content Analysis as a mixed methods approach (containing qualitative and quantitative steps of analysis) and advocates common research criteria for qualitative and quantitative research. Finally, a step-by-step model of the (qualitative-quantitative) research process is ...

Dimensions is used to predict the values of the units in the data corpus as a whole. For example, legislators’ positions in a two-dimensional space are used to predict their votes on bills. Such methods are transparent insofar as the corpus is shared. They are also improvable as new data become available, via Bayesian estimation.

Abstract
Neural network training relies on our ability to find “good” minimizers of highly non-convex functions. This task is facilitated by the loss landscape of the neural network, whose properties are unknown when the network is trained. Understanding the loss landscape provides insights into the training and generalization behavior of neural networks.

Theoretical Review of Phonics Instruction for - ed
Panel (2000) reviewed a large corpus of studies using meta-analytic techniques. Studies were selected by a carefully conscribed set of criteria, limiting review to research that was quantitative and published in peer-reviewed journals. They found the following: Phonics instruction produced significant effects on reading outcomes.
